

Redux Exercise

[Download starter code](#)

In this exercise, you will build a mood changer app that uses redux to alter the mood of a text emoji, as shown below:

You should use the starter ***index.html*** boilerplate.

You can use whatever ASCII faces you want. You can find a complete list of options [here](#). Note that the app starts with a default ASCII face that doesn't correspond to any of the moods.

Remember that since you are using Redux, **your reducer must be a pure function**. Your actions should include a **payload** with the new face.

For DOM manipulation you can use raw JavaScript or JQuery. Redux has been provided for you in a ***script*** tag within the starter code.

Do not build this application using React - this should strictly be done with Redux

Further Study

- Research what the ***subscribe*** method on a redux store does. How could you use a

subscribe to help refactor your mood app?

- Add a background color that corresponds to each mood.
- Add a random mood button
