

# Git Basics Exercise

Now that you have learned the basics of Git workflow, try running through this a couple of times on your own:

1. Create a folder called ***learn\_git\_again***.
2. ***cd*** into the ***learn\_git\_again*** folder.
3. Create a file called ***third.txt***.
4. Initialize an empty git repository.
5. Add ***third.txt*** to the staging area.
6. Commit with the message “adding third.txt”.
7. Check out your commit with ***git log***.
8. Create another file called ***fourth.txt***.
9. Add ***fourth.txt*** to the staging area.
10. Commit with the message “adding fourth.txt”
11. Remove the ***third.txt*** file
12. Add this change to the staging area
13. Commit with the message “removing third.txt”
14. Check out your commits using ***git log***
15. Change your global setting to ***core.pager=cat*** - you can read more about that [here](<https://git-scm.com/book/en/v2/Customizing-Git-Git-Configuration>).
16. Write the command to list all of the global configurations for ***git*** on your machine. You can type ***git config --global*** to find out how to do this
