```html
<script>

  // 1. When the DOM is ready, console.log the message
  //    "Let's get ready to party with jQuery!"

  $(function () {
    console.log("Let's get ready to party with jQuery!");

    // 2. Give all images inside of an article tag the class of image-center
    //    (this class is defined inside of the style tag in the head).

    $("article img").addClass("image-center");

    // 3. Remove the last paragraph in the article.

    $("article p:last-child").remove();

    // 4. Set the font size of the title to be a random pixel size from 0 to 100.

    $("#title").css("font-size", Math.random() * 100);

    // 5. Add an item to the list; it can say whatever you want.

    $("ol").append($("<li>", {text: "I can add to lists with jQuery!"}));

    // 6. Scratch that; the list is silly. Empty the aside and put a paragraph
    //    in it apologizing for the list's existence.

    $("aside")
        .empty()
        .append($("<p>", {text: "Sorry about that list :("}));

    // 7. When you change the numbers in the three inputs on the bottom,
    //    the background color of the body should change to match whatever
    //    the three values in the inputs are.

    $(".form-control").on('keyup blur change', function () {
      let red = $(".form-control").eq(0).val();
      let blue = $(".form-control").eq(1).val();
      let green = $(".form-control").eq(2).val();
      $("body").css("background-color",
          "rgb(" + red + "," + green + "," + blue + ")");
    });

    // 8. Add an event listener so that when you click on the image,
    //    it is removed from the DOM.

    $("img").on('click', function (e) {
      $(e.target).remove();
    });
  });

</script>
```
